

OVERVIEW

Door hardware covers all items that are fitted or related to the operation of doors and includes hinges, pivots, sliding door track assemblies, locks, latches, snibs, panic exit devices, closers, pull handles, sequence selectors, bolts, reed switches, buffers, power transfers, hold-open devices, seals, any part of an automatic closing device that is attached to the doorset and all door furniture.

Door hardware fitted to the door leaf of a fire door is considered to be part of the fire doorset. The fire resistance level of a doorset requires the door hardware to be of the same fire resistance level or higher. The fire resistance level of an item of door hardware is obtained from a fire test or an assessment by a recognised testing authority in Australia and New Zealand in accordance to the standard AS/NZS 1905 Part 1.

Door hardware can only be used on the type of fire door it has been approved for.

E-Core® Residential and Commercial fire doors

The E-Core® Residential (Mini) and Commercial (Maxi) fire doors have the same core ingredients but have varying fire performance characteristics. Due to this, door hardware approved for use on Commercial fire doors does not mean it can be used on Residential fire doors. In this section, the type of door the hardware is approved on is clearly detailed.

Testing of Door Hardware?

The range of E-Core® fire doors available and the vast distribution of E-Core® Residential and Commercial fire doors make an ideal choice for hardware companies to test their hardware on E-Core® Residential and Commercial fire doors. For more information on fire testing door hardware, visit our website at www.e-core.com.au

Ancillary Door Fixtures and Hardware

Ancillary door fixtures and hardware means those items that are generally affixed to doors after installation for various purposes. Examples include, but are not limited to, door knockers, door/room numbers, coat hooks, decorative panels and signage (e.g. fire stair notices). This includes surface mounted (glued or screwed) and through fixed fittings.

Due to the requirements of the Australian Standards, any ancillary door fixtures or hardware must be tested and approved. This means that any fire doorset found to have these items fitted will be unapproved and the tagging and certification will be voided.

Any requirement for these types of fittings should be referred to your E-Core® licensee for review.

Door Seals

The following is a summary of the seals approved for E-Core® fire doors. The main features of these seals are summarised as follows:

- A - Acoustic Seal
- DBS - Door bottom seal
- FDR - Fire Door Repair/Upgrade
- IS - Intumescent seals- generally suitable for medium to high temperature smoke
- MS - meeting stiles
- PBS - Physical barrier- generally suitable for ambient to medium temperature smoke
- Per. - Perimeter Seal
- TP - Threshold Plate

For other applications or features of these seals, please consult with the relevant seal manufacturers.
